INFORMATION SYSTEM MANAGEMENT

IMS566: ADVANCED WEB DESIGN DEVELOPMENT AND CONTENT MANAGEMENT

TITLE:

GROUP PROJECT: LOST AND FOUND (SHOPPING MALL)

PREPARED BY:

1.	SHARIFAH SHAHQIRUL NAZIERA BINTI SYED IDRUS	2025149357
2.	NUR SAKINAH BINTI JAMIRAN	2024219102
3.	NUR HUSNA BALQIS BT AHMAD AZAHARI	2024801184
4.	NUR ELLIA ESHAZREEN BINTI MOHD RAZI	2025107039
5.	SITI NAZIRA BINTI MOHD SAWAWI	2025187007

PREPARED FOR:

DR MUHAMMAD ASYRAF BIN WAHI ANUAR

GROUP:

CIM262 4B

DATE OF SUBMISSION:

2nd FEBRUARY 2026

ACKNOWLEDGEMENT

Alhamdulillah. All gratitude belongs to Allah SWT for granting us the ability to finish this assignment and for His willingness to do so. We can finish this assignment with a lot of energy and determination with His blessings.

Assalamualaikum w.b.t. We, Nur Ellia Eshazreen binti Mohd Razi, Siti Nazira binti Mohd Sawawi, Sharifah Shahqirul Naziera binti Syed Idrus, Nur Sakinah binti Jamiran and Nur Husna Balqis binti Ahmad Azahari owe a debt of gratitude to the following people who have contributed to the success of our assignment. We would like to thank them for all their valuable help on our preparation by finishing our assignment.

In fact, we would like to say thank you to our lecturer, Dr Asyraf as our lecturer of this subject, Advanced Web Design Development and Content Management (IMS566) who has guided us in doing this task since the day one and especially for answering all our question in this topic and helping us out in providing some useful information from the time the assignment was given until it has been submitted.

Furthermore, we would like to say thank you to my beloved family who supported us since we have to do this assignment.

Lastly, we want to thank everyone who were responsible for the making of each online source, and also those related to the libraries and bookstores where we conducted our article review, for all of them had helped us in completing the assignment.

1.0 INTRODUCTION

The Lost and Found Management System is essentially a web- based platform that helps to digitally record, locate and manage lost and found items in a shopping mall scenario. Many visitors coming to the shopping mall may lose their items unknowingly, especially during the high traffic periods like weekends, public holidays or major promotional events when the mall is very crowded and visitors are also carrying multiple shopping bags. This system is a digital version of the manual lost and found process as it offers a digitized and structured mode for visitors to report lost items, look up found items, and claim submission all through a web interface.

Looking from the management end, the system enables the mall staff to keep a record and manage the stored information of lost and found items systematically through a centralized database. Item details such as description, date when the item was found or lost, location, current status, ownership verification data are some of the key information that the management can record for each item. Implementing fundamental functions like authentication, CRUD (Create, Read, Update, Delete) operations, and search features into the system ensures that the data is not only accurate but also secure and readily available. The likelihood of records being lost, data duplication, and human errors, which are the common problems when handling lost and found items manually using paper- based methods, are greatly reduced.

2.0 GITHUB REPOSITORY LINK

<https://github.com/Sakinah25/Lost-and-Found-System.git>

3.0 ENTITY-RELATIONSHIP (ERD)

Figure 1.0: ERD of Lost and Found Management System

The Entity, Relationship Diagram (ERD) shows the relationship between the users and items tables in the Lost and Found Management System. The users table keeps user data such as username, password, and contact information, while the items table holds details of lost or found items like item name, category, status, description, and location details.

There is a one-to-many (1:M) relationship between the users and items tables in that one user can record multiple items, whereas each item is tied to only one user. This association is realized by having the `user_id` foreign key in the items table refer to the `id` primary key in the `users` table.

The ERD design above still guarantees the correct organization of data, referential integrity is preserved, and the system can easily identify which user has reported or handled each lost or found item.

4.0 SYSTEM REQUIREMENTS

The system requirements explain the hardware and software that are required to create and execute the Lost and Found Management System successfully. These requirements guarantee that the system runs smoothly, supports development operations, and prevents technical difficulties during testing and deployment. Through clearly defining the system requirements, developers may provide an appropriate environment for coding, database management, and system execution. The system requirements used to successfully develop and run the Lost and Found Management System are as follows:

- Windows version 10.0.26200.7623

Although Windows 10 is an old version of the Windows update, it also can be used to operate the system as our web developers have the Windows 10 version. It is utilized as the primary operating system for designing and executing the Lost and Found Management System. It offers an efficient and reliable environment that supports popular web development tools including Laragon, PHP, Composer, and phpMyAdmin. Windows 10 enables developers to run a local server, handle system files, and easily test applications during development. Furthermore, Windows 10 is extensively used and well-supported, making it ideal for software development, debugging, and system maintenance. Using Windows 10 ensures interoperability between development tools and the system, reducing technical difficulties and increasing development efficiency.

- PHP version 8.2.30-nts-Win32-vs16-x64

PHP is a popular server-side programming language that operates the backend of the Lost and Found Management System. It processes user requests, communicates with the database, and creates dynamic content for the system, such as submitting lost item reports, searching records, and managing claims. In this project, PHP version 8.2 is utilized and implemented in Laragon, a development environment that combines PHP with a web server and database, making setup and configuration easier. According to the official Laragon website, Laragon offers a fast, portable, and stable web development environment that supports different PHP versions and other tools.

- Composer version 2.8.12

Composer is a popular PHP dependency management solution that helps developers manage external libraries and packages necessary for a project. Composer guarantees that all required PHP libraries are automatically installed and updated in the Lost and Found Management System, making development easier and preventing compatibility concerns. It allows developers to define project dependencies in a single configuration file, and Composer will download and organize them into the appropriate directories. This makes project setup faster and more dependable, especially when utilizing frameworks or third-party tools. According to the official Composer website, Composer is required for modern PHP applications since it improves workflow, saves manual effort, and assures consistency across development environments. Composer allows developers to focus on creating features rather than managing separate libraries.

5.0 USER INTERFACE OVERVIEW

Setia City Mall's user interface is a centralized dashboard with a modern, clean structure that manages lost and found activities. It has a sidebar-driven navigation structure, which makes all operations simply accessible. Upon login, users are presented with a professional dashboard including a navigation sidebar on the left and a central information dashboard built for convenient tracking of missing items.

Figures 2.0: Dashboard Front Page

Figures 2.1: Dashboard Front Page

Figures 2.3: Dashboard Front Page

Figures 2.4: Dashboard Front Page

5.1 Sidebar Navigation

The sidebar serves as the main menu, allowing the user to navigate between different sections of the website:

- **Dashboard:** The standard homepage gives an overview of all recent activity and current item data.
- **Report:** A designated section where users may complete out forms to digitally record any lost or found items, including data like descriptions and locations.
- **FAQs:** A helpful guide page aimed to answer common user questions and give guidance on how to properly use the system or respond to any question about the lost items.
- **Profile:** This page provides users who are already registered to manage their personal account information and verify their identification inside the system.
- **Logout:** A safety function that allows users to safely exit their login session and protect their data from unauthorized access.
- **Settings:** This allows for general changes and the maintenance of user preferences, ensuring that the platform runs smoothly.

- *Contact*: A communication page where customers can look at contact messages or contact mall management for more help.
- *Audit Trail*: A specialized administrative tool that records and documents all actions performed within the system, ensuring complete transparency and accountability.

5.2 The Main Dashboard Area

The main dashboard is important to the system because it provides a visual overview of data collected through the centralized database.

5.2.1 Greeting and Statistical Overview

- *Personalized Greeting*: At the top, the system greets the visitor with a "Good Afternoon" greeting, establishing a pleasant and user-friendly environment.
- *Total Item Counters*: Two cards show the current number of Lost and Found Items. For example, the interface now displays 4 Lost Items (67%) and 2 Found Items (33%), providing users with information on how many items have been lost and found.

5.2.2 Quick Action Buttons

- *Report Lost Item*: A direct link to submit a report for a missing item.
- *Report Found Item*: A shortcut for reporting an item that was picked up by a visitor or staff member.
- *Browse Items*: This allows the user to see a full gallery or list of every item that is currently in the system's database.
- *Contacts*: A quick link to access the mall contact information for communication.

5.2.3 Data Analytics and Trends

- *Items by Category*: A doughnut chart classifies products into sections such as Electronic Devices, Accessories, Toys, and Personal products, allowing the mall to see which sorts of items are most commonly lost.

- *Lost vs Found Trends*: A detailed line graph shows the number of reports over time, from late 2025 to early 2026. This enables management to identify peak periods, such as January 2026, when reports grow dramatically.

5.2.4 Real-Time Activity Feed

- *Recent Lost Items*: Displays a list of missing items, such as "ring" or "iPhone 13," accompanied by the exact time and specific location (e.g., "level 2 near Daiso").
- *Recent Found Items*: Items currently held by the mall, such as "scarves" or a "Bunny" toy, are displayed, along with their discovery location (e.g., "nursery room level 2").
- *System Overview Footer*: A final summary line contains technical information, such as the overall number of objects in the system, active users, and the number of audit entries recorded.

6.0 FEATURES AND FUNCTIONALITIES

- **Login & Register**
Allows users and staff to create an account and log in securely to access the system.
- **Dashboard**
Displays a summary of system information such as lost items, found items, and recent activities.
- **Report (lost & found items)**
Enables users to report lost items and record found items with details like date, location, and description.
- **Faqs**
Provides answers to frequently asked questions to help users understand how to use the system.
- **Profile**
Allows users to view and update their personal information.
- **Logout**
Allows users to safely exit the system after completing their tasks.
- **Settings**
Enables system configuration and preference management.

- **User Management**
Allows administrators to manage user accounts, roles, and access permissions.
- **Contact**
Allows users to contact mall staff for support or inquiries.
- **Audit Trail**
Records all important system activities for monitoring, security, and accountability.

7.0 TEAM ROLES AND CONTRIBUTIONS

1. Web Developer

NAME	JOB
NUR SAKINAH BINTI JAMIRAN (Project Manager)	- Developed the web application based on project requirements. - Referenced example websites, textbooks, GitHub repositories, and AI assistance for learning and implementation guidance. - Implemented system features such as authentication, CRUD operations, and database integration. - Performed testing and debugging to ensure system reliability.
SHARIFAH SHAHQIRUL NAZIERA BINTI SYED IDRUS	
NUR HUSNA BALQIS BINTI AHMAD AZAHARI	

2. Report

NAME	JOB
NUR ELLIA ESHAZREEN BINTI MOHD RAZI	- Collected and organized information about the Lost and Found Management System for the report.
SITI NAZIRA BINTI MOHD SAWAWI	

8.0 CONCLUSION

In conclusion, the Lost and Found Management System represents a considerable improvement over conventional manual ways to process lost and found items inside a retail mall environment. The system improves overall operational efficiency by facilitating timely information retrieval, effective item tracking, and systematic data recording through the use of a web-based platform. Visitors and management can engage with the system in an organized and dependable way because of the digitalization of reporting, searching, and claim procedures.

Furthermore, the integration of critical system functionality such as user authentication, CRUD operations, and search capabilities provides data integrity, security, and consistency. The centralized database reduces the problems associated with manual techniques, such as data redundancy, record loss, and human error. All things considered, the deployment of this system supports enhanced visitor happiness and organizational effectiveness within the shopping mall context by enhancing service management, increasing transparency, and managing lost and found items more skillfully.

Finally, implementing a comprehensive and user-friendly dashboard gives mall management a great visual tool for making data-driven decisions. Real-time statistics, such as the "Items by Category" doughnut chart and the "Lost vs Found Trends" line graph, allow staff to quickly discover high-traffic periods and frequent categories of lost things. The addition of quick-access features, such as "Report Lost Item" buttons and a live feed of recent activity, guarantees that the system is not just advanced in terms of backend capabilities but also extremely accessible and efficient for everyday operational usage.
